

Bioethanol market data 2019: German manufacturers reduce production – market share of Super E10 increases

The German Bioethanol Industry Association (BDBe) has published the 2019 market data for the production and consumption of certified sustainable bioethanol. German bioethanol production, standardised for use as fuel, fell last year to 542,699 tonnes – which is 12.8% less than in the previous year. Sales of bioethanol were roughly on par with the previous year, with the market share of Super E10 rising by almost one percentage point to 13.7%.

In a fuel market that increased again slightly in 2019 with petrol sales of 18.0 million, about one per cent more than in the previous year (2018: 17.8 million tonnes), the consumption of bioethanol blended with Super E10, Super Plus and Super (E5) fuel or used to produce ETBE (ethyl *tert*-butyl ether), fell slightly to just under 1.16 million tonnes. Nearly 88,000 tonnes of bioethanol were used for ETBE production, which is about 20% less than in the previous year. In contrast, the market share of the fuel Super E10, which contains up to 10% bioethanol rose, from 12.9% to 13.7%. At 2.46 million tonnes, the sales volume was over 6% higher than in the previous year (2018): 2.31 million tonnes).

Bioethanol consumption (EtOH) in Germany (in tonnes)			
	2019	2018	+/-
EtOH total	1,160,954	1,187,362	-2.2%
thereof: EtOH as an admixture	1,072,990	1,077,434	-0.4%
thereof: EtOH as ETBE	87,964	109,928	-20.0%
Total petrol (incl. EtOH)	18,013,601	17,837,098	1.0%
Percentage of EtOH by volume in petrol	6.1%	6.3%

The total bioethanol share in Super Plus, Super (E5), Super E10 and ETBE was thus 6.1%. In 2018 this percentage was still 6.3 percent.

Domestic production of bioethanol for use as an additive in fuel fell by 12.8% to just under 543,000 tonnes. Compared to the previous year with a production volume of 622,232 tonnes, this represents a significant decline. This was due in part to an alignment of production with the more challenging market conditions at the beginning of 2019, which were characterised by weaker demand and volatile and falling prices for bioethanol.

In order to explain the official data related to mineral oil, BDBe Managing Director Stefan Walter not only looks to the past, but also explains the current trend: “On the positive side, motorists’ confidence in Super E10 has increased again, even though bioethanol sales stagnated overall last year. The increase in the greenhouse gas savings quota from four to six per cent at the beginning of the year also meant that bioethanol consumption in January 2020 was already almost six per cent higher than in the previous month of December. However, given the effects of the coronavirus pandemic that have been felt throughout Europe since March, forecasts for the entire current year are difficult.

“Currently, the demand for bioethanol for use as an admixture in petrol is declining significantly throughout Europe because demand for fossil fuels has also fallen due to output and contact restrictions. At the same time there is enormous demand for bioethanol as a basic material for the production of disinfectants. In the coronavirus crisis, our companies are now flexibly providing quantities of bioethanol as a basic material for disinfectants that are so urgently needed to protect public health.”

Regardless of the current reciprocal effects and uncertainty on the market, bioethanol in the form of alternative fuels will continue to play an important role in the future, says Walter. “There are currently around 47 million cars registered in Germany. More than 31.4 million of them have a petrol

engine, which is more than ever before. In the medium term, the major car manufacturers are planning considerable investment in the further development of the combustion engine. This shows that renewable fuels will be needed for a long time to come in order to achieve the climate targets. “In the wake of the coronavirus pandemic, it will be important to significantly increase the blending ratio of certified sustainable bioethanol in petrol: by increasing sales of Super E10 and quickly introducing petrol with more than 10% bioethanol content to the market,” concludes BDBe Managing Director Walter.
